Introduction

This document presents a cross-functional customizing project in SAP S/4HANA Materials Management (MM), focused on a logistics scenario involving procurement, inventory management, and internal stock movements.

The project was developed based on the SAP Learning Hub course Cross-Functional Customizing in SAP S/4HANA Materials Management, with the objective of gaining practical experience in SAP system configuration and understanding the integration between logistics and financial processes.

The scope of the project includes key areas of SAP MM customizing, such as organizational structure, material master data, valuation and account determination, purchasing, and inventory management. Special attention was given to cross-functional dependencies between Materials Management (MM) and Financial Accounting (FI), particularly in the context of automatic account determination and material valuation.

The configuration was performed using the SAP Implementation Guide (SPRO), following standard customizing paths and best practices. Due to limitations of the training environment, some advanced configurations—such as full financial integration, tax setup, and Material Ledger activation—could not be fully executed. Nevertheless, the underlying concepts were analyzed and documented to reflect real-world SAP implementation scenarios.

This project demonstrates how SAP S/4HANA supports integrated business processes and highlights the importance of proper system configuration in ensuring accurate and efficient logistics operations.

1. General Settings

This unit covers the fundamental system-wide settings required for Materials Management (MM) in SAP S/4HANA. These configurations provide the foundation for all logistics and business processes by defining global parameters such as currencies, units of measure, and working calendars.

1.1. Checking Settings for Countries and Currencies

In this step, country-specific settings and currency configurations are reviewed.

The company code is assigned a local currency (e.g., PLN), which is used for all financial and logistical transactions. These settings ensure consistency in valuation, reporting, and international business operations.

Choose Manage Purchase Order

Click on create and enter supplier

 This screenshot shows the 'New Purchase Order' form in the SAP Fiori interface. The form is divided into several sections: 'Basic Data', 'Organization', and 'Purchase Order Items'.

 In the 'Basic Data' section, the 'Purchasing Doc. Type' is set to 'Standard PO (NB)', the 'Currency' is 'United States Dollar (US...)', and the 'Supplier' is 'Olympic Protective Gear (1)'.

 In the 'Organization' section, the 'Purchasing Group' is highlighted with a red box, and the 'Purchasing Organization' is 'Global Bike US (US00)'.

 Below these sections is a table for 'Purchase Order Items'. The table has columns for 'Item', 'Item Category', 'Material', 'Short Text', 'Material Group', and 'Plant'. The table is currently empty, with a message 'No items available.' at the bottom.

Click on delivery and invoice and note the exchange rate

 This screenshot shows the 'Delivery and Invoice' form in the SAP Fiori interface. The form contains various fields for payment terms, days, and exchange rates.

 In the 'Payment Terms' section, the 'Payment Terms' field is set to '0001'.

 In the 'Days 2 / In Percent' section, the 'Days 2' field is set to '0' and the 'In Percent' field is set to '0,000'.

 In the 'Days 1 / In Percent' section, the 'Days 1' field is set to '0' and the 'In Percent' field is set to '0,000'.

 In the 'Days Net' section, the 'Days Net' field is set to '0'.

 In the 'Exchange Rate' section, the 'Exchange Rate' field is set to '1,00000'.

 In the 'Intrastat Relevance' section, the 'Intrastat Relevance' field is set to 'No'.

1.2. Defining units of measurement

Units of measurement (e.g., PC, KG, L) are defined and standardized across the system. These units are essential for material master data, inventory management, and procurement processes. Consistent units ensure accurate quantity tracking and reporting.

2. Defining and Assigning Plant

A plant represents a physical location where materials are stored, produced, or distributed. In SAP S/4HANA, plants are assigned to company codes and linked to other organizational units to enable logistics processes such as stock transfers and procurement.

3. Master Data

Master data plays a critical role in logistics processes, as it defines how materials are created, stored, purchased, and managed across the organization.

3.1. Creating material types

Material types define the behavior and attributes of materials in SAP. They control number ranges, field selection, and how materials are used in different processes.

Change field reference to ZM24 and save the data

The screenshot shows the SAP Material Master configuration screen for Material Type ZM24. The interface includes a top bar with 'New Entries' and 'More' options. The main area is divided into several sections: 'General data' (Field reference: ZM24, SRef: material type: ROH, Authorization group: , External no. assignment w/o check: ☒, X-Plant Mat.Status: , Item category group: , With Qty Structure: , Initial Status:), 'Special material types' (Material is configurable: , Material f. process: , Pipeline mandatory: , Mand. RP logistics: , Manufacturer part: , FFF Class: , Only EWM Stock:), 'Internal/external purchase orders' (Ext. Purchase Orders: 2, Int. purchase orders: 0), and 'Classification' (Class type: , Class:). A 'User departments' section on the right lists various departments with checkboxes, including Accounting, MRP, Purchasing, Production resources/tools, Costing, Basic data, Storage, Forecasting, Quality management, Warehouse management, and Sales. The bottom right corner has 'Save' and 'Cancel' buttons.

3.4. Configuring the Material Master

User-specific subscreens allow extending the material master with additional custom fields tailored to business requirements. This enables companies to capture specific data not available in the standard SAP system.

Open transaction SE80 and choose display or create object for Program, SAPLMGD1

The screenshot shows the SAP Object Navigator interface. The top bar includes the SAP logo and 'Object Navigator'. Below the bar is a search bar and a 'More' dropdown. The 'Repository Browser' section shows a tree view with 'Program' selected. The search results show 'SAPLMGD1' with a '63' icon. A tooltip 'Display or Create Object' is visible over the search results. The bottom of the screen shows a table with columns 'Object Name' and 'Description'.

Choose Screens

The screenshot shows the SAP 'Screens' selection screen. It features a search bar and a 'Screens' button with a magnifying glass icon.

4. Valuation and Account Assignment

Material valuation and account determination define how material movements are reflected in financial accounting. Valuation class links materials to general ledger accounts, ensuring correct financial postings.

4.1. Checking and Adjusting the Organizational Structure Settings Relevant for Account Determination

Proper assignment of plants to company codes and valuation areas is required for automatic account determination and accurate financial postings. This step ensures that the organizational structure supports correct financial postings for material movements.

SAP Customizing Implementation Guide->Enterprise Structure->Definition->Logistics - General->Define valuation level

Choose Valuation level

4.2. Creating Valuation Classes and Account Category References

Valuation class defines the financial classification of a material, while account category reference controls which valuation classes can be assigned to specific material types. Together, they enable automatic account determination in SAP S/4HANA.

4.6. Adjusting Settings for Split Valuation

Split valuation configuration enables multiple valuation types for a single material, allowing differentiation based on factors such as origin, batch, or condition. This provides flexibility in inventory valuation and financial reporting.

5. Purchasing

This unit focuses on the configuration of purchasing processes in SAP S/4HANA. It includes defining organizational elements, document types, and settings required to support procurement activities.

5.1. Creating Document Types in Purchasing

Document types in purchasing define different types of procurement documents, such as standard purchase orders and stock transport orders. They control how purchasing transactions are processed in the system.

SAP Customizing Implementation Guide->Materials Management->Purchasing->Purchase Order->Define Document Types for Purchase Orders

5.6. Controlling the Output of Messages in Purchasing

Message schema and message types were maintained to define how purchase order-related communications are triggered and delivered. This allows precise control over vendor notifications and supports compliance in procurement processes.

Materials Management > Purchasing > Messages > Output Control > Message Determination Schemas

Choose maintain message

Perform the activities in the specified order

 Choose

Click on RMBEF1 and double click on control data

5.7. Explaining the SAP S/4 HANA Output Management

Output management settings are used to ensure proper generation and delivery of purchasing documents such as purchase orders and stock transport orders. Different output types, mediums, and partner assignments are used to validate correct document processing.

Cross-Application Components > Output Control > Manage Application Object Type Activation

6. Inventory Management

Inventory Management controls stock movements and ensures accurate tracking of material quantities and values.

6.1. Adjusting Settings for Material and Accounting Documents

Configuration of material and accounting documents ensures that each goods movement generates consistent logistics and financial records. Proper document control enables traceability and accurate reporting across the system.

Conclusion

This project provided a comprehensive overview of Materials Management (MM) configuration in SAP S/4HANA, with a strong focus on cross-functional integration and real-world logistics scenarios.

Through the customization of organizational structure, master data, valuation, purchasing, and inventory management processes, it was possible to understand how different components of SAP interact to support end-to-end business operations.

A key outcome of the project was gaining insight into the integration between Materials Management (MM) and Financial Accounting (FI), particularly in the areas of valuation and automatic account determination.

Despite system limitations in the training environment, which restricted full configuration of certain elements such as tax settings and Material Ledger, the project allowed for analysis of critical dependencies and common system errors. This contributed to a deeper understanding of how SAP behaves in real implementation scenarios.

Overall, the project demonstrates practical knowledge of SAP S/4HANA MM customizing and highlights the importance of accurate system configuration in ensuring efficient, consistent, and transparent logistics and financial processes.
